Compounds of formula I, II and III as defined above and the compounds of the Examples are hereinafter referred to as Compounds of the Invention.

Compounds of the invention are either obtained in the free form, or as a salt thereof if salt forming groups are present.

Compounds of the Invention having basic groups can be converted into acid addition salts, especially pharmaceutically acceptable salts. These are formed, for example, with inorganic acids, such as mineral acids, for example sulfuric acid, a phosphoric or hydrohalic acid, or with organic carboxylic acids, such as (C₁-C₄)alkanecarboxylic acids which, for example, are unsubstituted or substituted by halogen, for example acetic acid, such as saturated or unsaturated dicarboxylic acids, for example oxalic, succinic, maleic or fumaric acid, such as hydroxycarboxylic acids, for example glycolic, lactic, malic, tartaric or citric acid, such as amino acids, for example aspartic or glutamic acid, or with organic sulfonic acids, such as (C₁-C₄)-alkylsulfonic

acids (for example methanesulfonic acid) or arylsulfonic acids which are unsubstituted or substituted (for example by halogen). Preferred are salts formed with hydrochloric acid, methanesulfonic acid and maleic acid.

In view of the close relationship between the free compounds and the compounds in the form of their salts, whenever a compound is referred to in this context, a corresponding salt is also intended, provided such is possible or appropriate under the circumstances.

The compounds, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization.

The compounds of the invention exhibit valuable pharmacological properties in mammals and are particularly useful as inhibitors of cathepsin K.

The cathepsin K inhibitory effects of the compound of the invention can be demonstrated in vitro by measuring the inhibition of e.g. recombinant human cathepsin K.

The in vitro assay is carried out as follows:

For cathepsin K:

The assay is performed in 96 well microtiter plates at ambient temperature using recombinant human cathepsin K. Inhibition of cathepsin K is assayed at a constant enzyme (0.16 nM) and substrate concentration (54 mM Z-Phe-Arg-AMCA - Peptide Institute Inc. Osaka, Japan) in 100 mM sodium phosphate buffer, pH 7.0, containing 2 mM dithiothreitol, 20 mM Tween 80 and 1 mM EDTA. Cathepsin K is preincubated with the inhibitors for 30 min, and the reaction is initiated by the addition of substrate. After 30 min incubation the reaction is stopped by the addition of E-64 (2 mM), and fluorescence intensity is read on a multi-well plate reader at excitation and emission wavelengths of 360 and 460 nm, respectively. Compounds of the Invention typically have IC_{50} s for inhibition of human cathepsin K of less than about 100nM down to about 1nM or less, preferably of about 5nM or less, e.g. about 1nM. Thus for example, the compounds of Examples I-22 and I-23 have IC_{50} s for inhibition of human cathepsin K of 3nM and 1.5 nM respectively.

In view of their activity as inhibitors of cathepsin K, Compounds of the Invention are particularly useful in mammals as agents for treatment and prophylaxis of diseases and medical conditions involving elevated levels of cathepsin K. Such diseases include diseases involving infection by organisms such as pneumocystis carinii, trypanoma cruzi, trypanoma brucei, crithidia fusiculata, as well as parasitic diseases such as schistosomiasis and malaria, tumours (tumour invasion and tumour metastasis), and other diseases such as metachromatic leukodystrophy, muscular dystrophy, amyotrophy and similar diseases.

Cathepsin K, has been implicated in diseases of excessive bone loss, and thus the Compounds of the Invention may be used for treatment and prophylaxis of such diseases, including osteoporosis, gingival diseases such as gingivitis and periodontitis, Paget's disease, hypercalcemia of malignancy, e.g. tumour-induced hypercalcemia and metabolic bone disease. Also the Compounds of the Invention may be used for treatment or prophylaxis of diseases of excessive cartilage or matrix degradation, including osteoarthritis and rheumatoid arthritis as well as certain neoplastic diseases involving expression of high levels of proteolytic enzymes and matrix degradation.

Compounds of the Invention, are also indicated for preventing or treating coronary disease, atherosclerosis (including atherosclerotic plaque rupture and destabilization), autoimmune diseases, respiratory diseases and immunologically mediated diseases (including transplant rejection).

Compounds of the Invention are particularly indicated for preventing or treating osteoporosis of various genesis (e.g. juvenile, menopausal, post-menopausal, post-traumatic, caused by old age or by cortico-steroid therapy or inactivity).

Beneficial effects are evaluated in in vitro and in vivo pharmacological tests generally known in the art, and as illustrated herein.

The above cited properties are demonstrable in in vitro and in vivo tests, using advantageously mammals, e.g. rats, mice, dogs, rabbits, monkeys or isolated organs and tissues, as well as mammalian enzyme preparations, either natural or prepared by e.g. recombinant technology. Compounds of the Invention can be applied in vitro in the form of solutions, e.g. preferably aqueous solutions or suspensions, and in vivo either enterally

or parenterally, advantageously orally, e.g. as a suspension or in aqueous solution, or as a solid capsule or tablet formulation. The dosage in vitro may range between about 10^{-5} molar and 10^{-9} molar concentrations. The dosage in vivo may range, depending on the route of administration, between about 0.1 and 100 mg/kg.

The antiarthritic efficacy of the Compounds of the Invention for the treatment of rheumatoid arthritis can be determined using models such as or similar to the rat model of adjuvant arthritis, as described previously (R.E. Esser, et. al. J. Rheumatology, 1993, 20, 1176.)

The efficacy of the compounds of the invention for the treatment of osteoarthritis can be determined using models such as or similar to the rabbit partial lateral meniscectomy model, as described previously (Colombo et al. Arth. Rheum. 1993 26, 875-886). The efficacy of the compounds in the model can be quantified using histological scoring methods, as described previously (O'Byrne et al. Inflamm Res 1995, 44, S117-S118).

The efficacy of the compounds of the invention for the treatment of osteoporosis can be determined using an animal model such as the ovariectomised rat or other similar species, e.g. rabbit or monkey, in which test compounds are administered to the animal and the presence of markers of bone resorption are measured in urine or serum (e.g. as described in Osteoporos Int (1997) 7:539-543).

Accordingly in further aspects the invention provides:

A Compound of the Invention for use as a pharmaceutical;

a pharmaceutical composition comprising a Compound of the Invention as an active ingredient;

a method of treating a patient suffering from or susceptible to a disease or medical condition in which cathepsin K is implicated, comprising administering an effective amount of a Compound of the Invention to the patient, and

the use of a Compound of the Invention for the preparation of a medicament for therapeutic or prophylactic treatment of a disease or medical condition in which cathepsin K is implicated.

The present invention relates to methods of using Compounds of the Invention and their pharmaceutically acceptable salts, or pharmaceutical compositions thereof, in mammals for inhibiting cathepsin K, and for the treatment of cathepsin K dependent conditions, such as the cathepsin K dependent conditions, described herein, e.g. inflammation, osteoporosis, rheumatoid arthritis and osteoarthritis.

Particularly the present invention relates to a method of selectively inhibiting cathepsin K activity in a mammal which comprises administering to a mammal in need thereof an effective cathepsin K inhibiting amount of a Compound of the Invention.

More specifically such relates to a method of treating osteoporosis, rheumatoid arthritis, osteoarthritis, and inflammation (and other diseases as identified above) in mammals comprises administering to a mammal in need thereof a correspondingly effective amount of a Compound of the Invention.

The following examples are intended to illustrate the invention and are not to be construed as being limitations thereon. Temperatures are given in degrees Centigrade. If not mentioned otherwise, all evaporations are performed under reduced pressure, preferably between about 15 and 100 mm Hg (= 20-133 mbar). The structure of final products, intermediates and starting materials is confirmed by standard analytical methods, e.g. microanalysis and spectroscopic characteristics (e.g. MS, IR, NMR). Abbreviations used are those conventional in the art.

EXAMPLES

Example I describes the preparation of 2-Cyano-Pyrimidine-5-ylmethyl-amides

1. N-[2-Cyano-4-(2,2-dimethyl-propylamino)-Pyrimidin-5-ylmethyl]-2-(4-methoxy-phenyl)-acetamide

A. 2,4-Dichloro-5-chloromethyl-pyrimidine

To 50 ml of POCl_3 is added 21.5 g (103.5 mmol) of PCl_5 and 4.0 g (27.6 mmol) of 5-(hydroxymethyl)-uracil. The resulting reaction mixture is stirred at 115 °C for 15 h. The reaction mixture is then cooled to r.t. and distilled, to yield 2,4-dichloro-5-chloromethyl-pyrimidine as a colourless liquid, boiling point 74 °C (0.01 mbar).

$^1\text{H-NMR}$ (300 MHz, CDCl_3): 8.64 (s, 1H) , 4.62 (s, 2H).

B. (2-Chloro-5-chloromethyl-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine

A solution of 3.47 g (17.57 mmol) of 2,4-dichloro-5-chloromethyl-pyrimidine and 2.9 ml (21.08 mmol) triethylamine in 29 ml of THF is cooled to - 5 °C and 2.2 ml (17.57 mmol)

2,2-dimethyl-propylamin is added over a period of 15 minutes. The reaction mixture is stirred at -5 °C for additional 2 h, then diluted with ethyl acetate and extracted once with brine. The organic layer is separated and dried over Na₂SO₄. Purification of the crude product by flash chromatography (hexanes/ethyl acetate) yields (2-chloro-5-chloromethyl-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine as white crystals.

MS (ES⁺) : 249 (M + H)⁺

¹H-NMR (300 MHz, CDCl₃): 7.94 (s, 1H), 5.4 (m (broad), 1H), 4.47 (s, 2H), 3.4 (d, 2H), 1.02 (s, 9H).

C. (5-Azidomethyl-2-chloro-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine

A solution of 1.47 g (5.92 mmol) of (2-chloro-5-chloromethyl-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine and 0.46 g (7.1 mmol) NaN₃ is dissolved in 6 ml of DMF and was stirred at 30 °C for 2.5 hours. Then the reaction mixture is cooled to r.t., diluted with ethyl acetate and twice extracted with H₂O. The organic layer is separated and dried over Na₂SO₄. Evaporation of the ethyl acetate yielded (5-azidomethyl-2-chloro-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine as white crystals.

Mp.: 133 – 136 °C.

MS (ES⁺) : 255 (M + H)⁺

¹H-NMR (300 MHz, CDCl₃): 7.92 (s, 1H), 5.49 (t (broad), 1H), 4.2 (s, 2H), 3.37 (d, 2H), 1 (s, 9H).

D. (5-Aminomethyl-2-chloro-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine

A solution of 1.47 g (15.77 mmol) (5-azidomethyl-2-chloro-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine and 1.67 g (6.35 mmol) of triphenylphosphine in 20 ml of THF and 0.08ml of H₂O is stirred at r.t. for 24 h.. Then the solvent is removed and the residue dissolved in 40 ml EtOH and 17 ml NH₃ (25%). This reaction mixture is stirred for 48 h at r.t. and again the solvent is removed. The residue is dissolved in diethylether and twice extracted with 25 ml of 1N HCl. Both acidic extracts were combined and once more extracted with diethylether, then the acidic layer is evaporated under vacuo. The solid residue was triturated with diethylether yielding (5-Aminomethyl-2-chloro-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine 2HCl as slightly yellow crystals.

MS (ES⁺) : 229 (M +H)⁺

The following amine derivatives are obtained by dissolving (2-Chloro-5-chloromethyl-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine (**1B**) and 1 equivalent of DIEA in DMF, cooling to 0° C and adding 1 equivalent of the corresponding amine dropwise at 0° C. The reaction mixture is stirred at 0° C for 12 h , then diluted with ethyl acetate and extracted once with brine. The organic layer is separated and dried over Na₂SO₄. The product is purified by flash chromatography.

The piperazinyl-benzoic acid precursors used in the preparation of the above compounds may be prepared substantially as described below for the reference 4-[4-[(2-methoxyethyl)-piperazin-1-yl]benzoic acid precursor.

Preparation of piperazinyl-benzoic acids:

A) 4-[4-(2-Methoxy-ethyl) -piperazin-1-yl]benzoic acid methyl ester

To 10 ml of 1,4-dioxan is added 0.645 g (3.0 mmol) of methyl-4-bromobenzoate 0.519 g (3.6 mmol) of 1-(2-methoxy-ethyl-piperazine, 0.892 g (8.47 mmol) of potassium phosphate, 0.177 g (0.45 mmol) of 2-dicyclohexylphosphino-2'-(N,N-dimethyl-amino)biphenyl and 0.137 g (0.15 mmol) tris-(benzylideneacetone)palladium (0). The resulting reaction mixture is stirred under argon for 5 hours at 100 °C, then cooled to room temperature, diluted with ethyl acetate and filtered. The filtrate is washed once with H₂O and once with brine, the organic layer separated and dried over Na₂SO₄. Purification of the crude product by flash chromatography (dichloromethane/methanol) yields 0.52 g of 4-[4-(2-methoxy-ethyl) -piperazin-1-yl]benzoic acid methyl ester as a solid.

MS (ES⁺): 279 (M+H)⁺

¹H-NMR (300 MHz, CDCl₃): 7.94 (d, 2H), 6.87 (d, 2H), 3.88 (s, 3H), 3.55 (t, 2H), 3.38 (s, 3H), 3.36 (m, 4H), 2.68 (m, 6H).

B) 4-[4-(2-Methoxy-ethyl)-piperazin-1-yl]-benzoic acid sodium salt

To 4 ml of MeOH/H₂O (1:1) is added 0.52 g (1.87 mmol) of 4-[4-(2-methoxy-ethyl) -piperazin-1-yl]benzoic acid methyl ester and 0.078 g (1.96 mmol) of NaOH (30%). The resulting reaction mixture is stirred 1 hour at 80° C, then cooled to room temperature and

diluted with H₂O. The H₂O-layer is extracted 3 times with diethyl ether and then lyophilised to yield 0.47 g of 4-[4-(2-methoxy-ethyl)-piperazin-1-yl]-benzoic acid sodium salt as a white solid.

MS (ES⁺): 265 (M+H)⁺

¹H-NMR (300 MHz, CD₃OD): 7.97 (d, 2H), 7.04 (d, 2H), 3.72 (t, 2H), 3.50 (s, 3H), 3.42 (m, 4H), 2.82 (m, 6H).

Example II-1.

2-Cyano-4-(2,2-dimethyl-propylamino)-pyrimidine-5-carboxylic acid 4-methoxy-benzylamide

A. 2-Chloro-4-(2,2-dimethyl-propylamino)-pyrimidine-5-carbaldehyde

To a solution of (5-bromo-2-chloro-pyrimidin-4-yl)-(2,2-dimethyl-propyl)-amine (30 g, 108 mmol) in THF (500 ml) is added n-butyllithium (1.6 mol/l in n-hexane, 148 ml, 237 mmol) dropwise at -78°C and the mixture is stirred for 10 min. Ethylformate (19 ml, 230 mol) is added dropwise to the mixture at -78°C , and the reaction mixture is allowed to warm to ambient temperature. After being stirred for 1 hour, the reaction mixture is quenched with saturated NH_4Cl at -78°C and then extracted with AcOEt.
